isn't running, it may be because fuel levels are too low. While some RV generators will run until the fuel tank has nothing but fumes, the Onan models tend to stop working when you're down to a quarter tank. The units that do this are the ones drawing from the gas tank.

a result of using this Troubleshooting Guide. Getting the Engine Running Before any evaluation of the controls, regulator or generator can proceed, the Onan engine must have oil and fuel, be in running condition and the 12-volt battery charged. The electronic governor, 151-0752, on Models BGM and NHM, Spec B and later, must be functioning

Bill, I've worked on
many onan engines
over the last 4 or 5 yrs
with all kinds of
confusing problems,
First of all on the p-216
to p-220 the coil fires
both plugs at once so if
it is a problem both
cylinders will misfire.

Locate the screw in the governor arm. Turn the screw until the engine is running as smoothly as possible at full load, then allow the engine to idle. The engine should idle down smoothly with no sputtering at any point. Make adjustments to this screw until the engine runs smoothly at full speed and at idle. references.
