A mercury vapour turbine is a form of heat engine that uses mercury as the working fluid of its thermal cycle. A mercury vapour turbine has been used in conjunction with a steam turbine for generating electricity.This example of combined cycle generation was not widely adopted, because of high capital cost and the obvious toxic hazard if the mercury leaked into the environment.

A liquid (in the patent Malone recommends either mercury or an alloy of mercury and lead) is moved from a cold area to a hot area, where it expands and does work. It is moved by a displacer and passes through a porous regenerator 25 made of 'fine wires', to conserve heat and so improve efficiency; this is a liquid version of a Stirling hot-air engine.
